About

I am a first-year Computer Science Engineering student with a keen interest in technology, data analysis, artificial intelligence, and space exploration. I am passionate about learning new technologies, strengthening my programming and problem-solving skills, and understanding how data-driven solutions can contri... more

1. Project Brief

Project Title: Rooftop Solar Energy Monitor

The Rooftop Solar Energy Monitor is a Java application which monitors and analyses the performance of the rooftop solar energy system. Its main aim is to read all the relevant parameters of the solar panels, including voltage, current, temperature, irradiance and operating time, calculate the power, energy and efficiency, and check if it operates normally or not. The application also allows detecting abnormal values and notifying or alerting the user about them.

2. Abstract

Rooftop solar energy systems offer clean electricity, but their output often depends on sunlight, temperature, shade, dust and other factors. Rooftop solar energy monitors track these statistics to help consumers get the most out of their investment. The proposed Rooftop Solar Energy Monitor is a java application that processes solar monitoring data such as voltages, currents, temperatures, irradiance, and operating time.

The software calculates the electrical power and energy generated from the rooftop solar systems using the values. It determines the percentage of power generated using the input solar data and the calculated electrical data to monitor the system's efficiency while considering temperature and other variables. The application can also compare results with set thresholds, identify anomalies, and notify the user when action is needed. The information is displayed in a more manageable and comprehensible format to allow users to monitor the system performance and productivity conveniently. The project
